

Fall Protection Training

The construction industry has detailed requirements for fall protection systems and training as outlined by OSHA. General industry is mostly concerned with fall protection for employees who use manlift types of equipment.

This training session is intended to be a general overview of fall protection for any employees required to work at heights greater than 6 feet above the ground.

In this training session we will discuss a number of general concerns with fall protection that could apply to many situations.

This training session will focus on:

- Fall hazard recognition
- Basic fall protection principles
- Selection & application of fall protection systems
- Review of applicable, industry-related standards
- Proper equipment cleaning & storage
- Formal inspection procedure & documentation process
- Round-table discussion of fall protection issues
- Writing a fall protection program
- Rescue program
