

Hazard Communication

The Occupational Safety and Health Administration (OSHA) has created the Hazard Communication Standard to help ensure your safety when working with chemicals.

OSHA requires employers to have a written Hazard Communication Program. The program demonstrates the employer's commitment to helping employees work safely with the chemicals that are used in the workplace.

The Hazard Communication Standard requires employee training to include:

- A discussion of the operations at your company that use hazardous chemicals
 - Hazard Communication (Right to Know) Standard
 - How to detect the presence or release of a hazardous chemical
 - A discussion of the physical and health hazards of chemicals.
 - How employees can protect themselves from the hazardous chemicals
 - PPE, first aid, spills and leaks
 - How to read and understand Labels and MSDSs
-
- This training session will cover the basics of all the required topics.
